

The Last-Mile Logistics Auditor

Veridi Logistics · delivery-estimate accuracy audit

- Question: are we failing specific regions, or nationwide?
- Data: Olist Brazilian E-Commerce (~96k delivered orders audited)
- Method: clean joins → delay classification → geographic, sentiment & cost analysis

Joseph Forson

Data Engineer

1 · National baseline — late rate 8.1%

Only ~8% late nationally — but this average hides a sharp regional split (next).

2 · It is REGIONAL — late-rate by state

The North-east (AL ~24%, MA ~20%, PI/CE/SE ~15%) runs 2-3x the national rate; the São-Paulo-centred south-east is the most reliable.

3 · Worst regions ranked

Distance from the São Paulo hub drives delivery time ($r \approx 0.91$), the mid-distance North-east carries the worst lateness because its estimates aren't padded enough.

4 · Lateness destroys satisfaction

On Time 4.29★ → Late 3.46★ → Super Late 1.78★. The negative-review spike is a logistics problem, not a product problem.

5 · Candidate's Choice — where the time leaks

Carrier transit is ~74% of total delivery time and explodes 8→26 days on late orders. The fix is the carrier / last-mile network, not the warehouse.

6 · Candidate's Choice — revenue at risk

≈ R\$1.35M (8.8%) of revenue sits on late orders, concentrated in high-volume SP/RJ/MG.

Recommendations

Targeted levers, not 'ship faster everywhere'

- ✓ Improve last-mile / carrier network in the North-east (AL, MA, PI, CE, SE)
- ✓ Recalibrate the delivery promise per state so it matches reality
- ✓ Protect revenue in SP/RJ; protect reputation in the North-east
- ✓ Monitor late-rate, bottleneck & revenue-at-risk monthly via the dashboard
